

ABSTRACT

Featured is a mobile computer system that includes a computer, a computer embodying wireless technology, and a power supply that is operably coupled to the computer so the computing device or computer is operated and functional remote from fixed power sources. The power supply is configured so as to have a capacity sufficient for powering the computer and any peripherals or other components operably coupled thereto. The mobile system also includes a moving device that is configured and arranged so as to removably support the power supply and the computer as well as any peripherals and so the moving device along with the attached power supply and computer can be selectively moved between different locations such as by wheels.
